DEPARTMENT OF LABORATORY MEDICINE - BIOCHEMISTRY

Venous Blood Gas Analysis:

- Analysis of arterial and mixed venous blood provides information concerning the oxygenation, ventilatory, and acid-base status of the patient from whom the specimen was obtained.
- Analysis of samples from other sources (ie, capillary, peripheral venous, umbilical venous samples, and pH measured from other body fluids) may provide limited information. The variables most generally measured are the $PaCO_2$, PaO_2, and pH.
- While there is some evidence that venous and arterial pH, PCO_2, and HCO_3 may have sufficient agreement as to be clinically comparable in a variety of clinical settings, the venous blood gas (VBG) obtained from a central line should be considered a surrogate for arterial blood gas (ABG) only in very specific clinical circumstances.
