**DEPARTMENT OF LABORATORY MEDICINE - IMMUNOLOGY**

| Test Name                                                                                                              | Result         | Units | Biological Reference Range          |
|------------------------------------------------------------------------------------------------------------------------|----------------|-------|-------------------------------------|
|  Anti dsDNA ELISA IgG<br>(Serum,ELISA) | Less than 10.0 | IU/ml | Negative: < 100<br>Positive: >= 100 |

**Anti dsDNA IgG:**

1. Anti dsDNA antibodies are detectable in approximately 85% cases of SLE. Weakly-positive results caused by low-avidity antibodies to dsDNA are not specific for SLE and can occur in a variety of diseases. Testing for these IgG antibodies is indicated if ANA is positive along with clinical signs and symptoms compatible with SLE. If the ANA test is negative, test is not advised.
2. Levels are known to fluctuate with disease activity in SLE, often increasing prior to an inflammation and decreasing in response to therapy.
3. The assay results for autoantibodies are ancillary hence therapeutic decision, disease activity or response to treatment based solely on result values are not generally recommended. Reported results are for the information of the referring Clinician. Results should be interpreted in correlation with medical history, clinical presentation and other findings.
4. Reference ranges and clinical information/interpretations are traceable to kit inserts/textbooks/defined guidelines and "<https://www.mayocliniclabs.com/test-catalog/index.html>".
