DEPARTMENT OF LABORATORY MEDICINE - BIOCHEMISTRY

Urea:

Urea is the final degradation product of protein and amino acid metabolism. Blood urea nitrogen currently is the most widely used screening test for the evaluation of kidney function. Protein catabolism causes formation of ammonia which is synthesized to urea with and elimination of excess nitrogen in the liver. Increased blood urea nitrogen may be due to cardiac decompensation, water depletion due to decreased intake and excessive loss, increased protein catabolism, high protein diet, acute glomerulonephritis, chronic nephritis, polycystic kidney disease, nephrosclerosis, tubular necrosis and all types of obstruction of the urinary tract.
